Simple Basic Types

Boolean

true

Unique instance of True class

false

Unique instance of the False class

Smalltalk uses true and false for boolean values

Boolean operators ($2 > 10$) result in true or false

Integers (0, 1, etc) can not be used for boolean values

nil

Value of an uninitialized variable

Unique instance of the UndefinedObject class

Numbers

Integer

Float

Double

Fraction

Fixed-Point

Integer

Smalltalk supports Integers of arbitrary size

Available memory dictates integer range

- 536870912 to 536870911 (29 bits) are handled efficiently

Integers larger than 29 bits require multiple words

Literal Forms

1234

1234567890123456789012345678901234567890123456

With base <base>r<number>

Expression	Value
16rFF	255
8r11	9
3r120	15

Examples

1 + 2

-123 abs

Float

Floating-point precision numbers

About 8 digits of accuracy

Range $\pm 10^{38}$

Literal forms

Expression	Value
12.34	12.34
12.3e2	1230.0
3.14e-10	3.14e-10

Double

IEEE 64-bit floating-point numbers

About 14 or 15 digits of accuracy

Range $\pm 10^{307}$

In scientific notation use d instead of e

Expression	Value
12.34d	12.34d
12.34d2	1234.0d
12.34 asDouble	12.340000152588d

Converting & Comparing Floating Point Numbers

Why does 12.34 asDouble result in 12.340000152588d?

12.34 is a decimal number

Most decimal numbers do not have exact binary representations

If you want a double start as a double

Exact comparisons of floating point numbers are dangerous

$0.1 * 0.1 = 0.01$ is false

Fixed-Point Numbers

Contain a fixed number of decimal places

Calculations are done using specified precision

Examples

10s3

12.34s

12.34s5

s indicates this is a fixed-point number

The integer after s indicates number of decimal places

If no integer after the s, then use precision of the number

Expression	Result
$2.12s + 3.2s2$	5.32s
$2s3 / 3$	0.667s
$2.11s + 2.1s$	4.21s
$0.1s * 0.1s$	0.0s

Fraction

Integer division results in a fraction

Expression	Result
$1/2$	$(1/2)$
$(1/2) + (1/3)$	$(5/6)$
$(2r11/16rAA) * 2$	$(3/85)$

Converting Fractions to Floats

Operations with floats convert fractions to floats

The asFloat message converts a fraction to a float

Expression	Result
$1/2$ asFloat	0.5
$(1/2) + 1.5$	2.0
$(1.0/3)$	0.3333333333333333

Converting Between Numbers

Important messages for any number

asDouble

asFloat

asFixedPoint: precision

asInteger

asRational "convert to fraction"

Examples

Expression	Result
(1/3) asDouble	0.3333333333333333d
(1/3) asFloat	0.333333
(1/3) asFixedPoint: 3	0.333s
(1/3) asRational	(1/3)
0.25 asRational	(1/4)
0.37 asRational	(284261/768273)
0.37s asRational	(37/100)
0.37d asRational	(37/100)
5 asFixedPoint: 3	5.000s
5.43 asInteger	5
5.43 asDouble	5.4299998283386d
5.432d asFixedPoint: 2	5.43s
5.437d asFixedPoint: 2	5.44s

Some Numerical Methods

Arithmetic

* + - / // \ abs negated quo: reciprocal rem:

		Result
division	4/2	4/2
integer division	5//2	2
modulo	5\\2	1
	-3 abs	3
	5 negated	-5

Rounding

4.2 ceiling	5
4.2 floor	4
3.1523 roundTo: 0.01	3.15
4.2 truncated	4

Testing

3.2 even	false
-3 sign	-1

odd, isZero, negative, positive, strictlyPositive

Others

arcCos, arcSin, arcTan, cos, exp,
 floorLog:, ln, log, log:, raisedTo:,
 sin, sqrt, squared, tan

Characters

Various ways to reference a single character

| aChar |

aChar := \$a.

aChar := \$5.

aChar := Character tab.

aChar := Character value: 65.

aChar := 65 asCharacter.

aChar := 'cat' at: 1. "indexing starts at 1"

Character class provides class methods for white space characters

backspace

cr

del

esc

space

leftArrow

lf

del

tab

newPag

e

Some Character Operations

asciiValue	digitValue	<	=
>	isDigit	isLetter	isLowercase
isSeparator	isUppercase	isVowel	asCharacter
asInteger	asLowercase	asSymbol	asUppercase

\$a isVowel returns true

What about Strings?

Smalltalk does have strings. Some important string methods use blocks. So we will first cover blocks. We will get back to strings.

Control Messages

If

Format (4 versions)

(boolean expression) ifTrue: trueBlock

(boolean expression) ifFalse: falseBlock

(boolean expression) ifFalse: falseBlock ifTrue: trueBlock

(boolean expression) ifTrue: trueBlock ifFalse: falseBlock

Examples

```
difference := (x > y)
    ifTrue: [ x - y]
    ifFalse: [ y - x]
```

```
a < 1 ifTrue: [Transcript show: 'hi mom' ]
```

```
x sin < 0.5 ifTrue:
    [y := x cos.
     z := y + 12.
     w := z cos]
```

Boolean Expressions

Logical Operations

	Symbol	Example
Or		a b
And	&	a & b
Exclusive OR	xor:	a xor: (b > c)
Negation	not	(a < b) not

Lazy Logical Operations

	Message	Example
Or	or: orBlock	a or: [b > c]
And	and: andBlock	a and: [c b]

The orBlock is evaluated only if the receiver of or: is false

The andBlock is evaluated only if the receiver of and: is true

Performance Note

To improve performance the compiler inlines some messages.

Since it does not make sense to send `ifTrue:` to anything but `true` and `false`, `ifTrue:` and `ifFalse:` messages are inlined. So they look like messages and they seem to act like messages, they do have the overhead of messages. One does not realize this unless one tries to modify the `ifTrue:` `ifFalse:` methods in the `True` and `False` classes. The changes would not have any effect.

Can I send `ifTrue:` to a non-Boolean?

Smalltalk compilers do not check for type usage

Type usage is check at runtime

If you send a message to an object that it does not implement a runtime error results

So if you execute the following you get a runtime error not a compile error:

```
5 ifTrue: [1 + 3 ]
```

Type Checking & Binding Time

A number of people believe that large programs can not be written in languages without typing, preferable strong type checking. They believe that without the compiler checking type usage programmers will make too many type usage errors. This will slow the development of programs and result in too many errors. Smalltalk is strongly typed. It is just that types are checked at run time. Programmers using Smalltalk, Lisp, Perl, APL, Python or Ruby (to name a few) tend to believe that type usage slows program development. Mixing these two groups of people in newsgroups results in many flame wars. These flame wars are a waste of emotional energy. Try Smalltalk and see for yourself. You might find that for you type checking at compile time is very important. If so then you know it by experience rather than repeating what you were told in a course. You might find that you do just fine without compile time type checking.

A Style Issue

Both of the following have the same effect

Which to use?

```
difference := (x > y)
  ifTrue: [ x - y]
  ifFalse: [ y - x]
```

```
(x > y)
  ifTrue: [difference := x - y]
  ifFalse: [difference := y - x]
```

Smalltalkers use and prefer the first version¹.

The main goal of the above statements is to assign a value to difference. The first statement makes this clear. The second statement makes you work to see the both paths of the computation assign a value to difference

¹ See Smalltalk Best Practice Patterns, Kent Beck, Conditional Expression Pattern, page 180.

isNil

isNil

Answers true if receiver is nil otherwise answers false

Common Usage

x isNil

ifTrue: [do something]

ifFalse: [do something else]

Shortcuts

ifNil:ifNotNil:

ifNotNil:ifNil:

ifNil:

ifNotNil:

x

ifNil: [do something]

ifNotNil: [do something else]

Blocks

- A deferred sequence of actions – a function without a name
- Can have 0 or more arguments
- Executed when sent the message 'value'

Similar to

- Lisp Lambda- Expression
- C function
- Anonymous functions

General Format

```
[ :variable1 :variable2 ... :variableN |  
  | blockTemporary1 blockTemporary2 ... blockTemporaryK |  
  expression1.  
  expression2.  
  ... ]
```

Zero Argument Block

```
| block x |  
x := 5.  
block := [Transcript show: x printString].  
x := 10.  
block value
```

Prints 10 in the Transcript window

```
| block x |  
x := 5.  
block := [:argument | Transcript show: (x + argument) printString].  
x := 10.  
block value: 4
```

Prints 14 in the Transcript window

Blocks and Return Values

Blocks return the value of the last executed statement in the block

```
| block x |  
block := [:a :b |  
          | c |  
          c := a + b.  
          c + 5].
```

x := block value: 1 value: 2.

x has the value 8

Blocks and Arguments

`[2 + 3 + 4 + 5] value`

`[:x | x + 3 + 4 + 5] value: 2`

`[:x :y | x + y + 4 + 5] value: 2 value: 3`

`[:x :y :z | x + y + z + 5] value: 2 value: 3 value: 4`

`[:x :y :z :w | x + y + z + w] value: 2 value: 3 value: 4 value: 5`

Using the `value:` keyword message up to 4 arguments can be sent to a block.

`[:a :b :c :d :e | a + b + c + d + e] valueWithArguments: #(1 2 3 4 5)`

`[:a :b | a + b] valueWithArguments: #(1 2)`

With the keyword message `valueWithArguments:` 1 or more arguments can be sent to a block

The argument to `valueWithArguments:` must be an array

`#(1 2 3)` creates an array.

More on arrays soon.

Where is the Value Message?

In the message:

```
difference := (x > y)
    ifTrue: [ x - y]
    ifFalse: [ y - x]
```

where is value sent to the blocks?

In the False class we have:

```
ifTrue: trueAlternativeBlock ifFalse: falseAlternativeBlock
    ^falseAlternativeBlock value
```

In the True class we have:

```
ifTrue: trueAlternativeBlock ifFalse: falseAlternativeBlock
    ^trueAlternativeBlock value
```

The value message is send to the correct block in the True or False class depending on the value of (x > y)

Basic Loops

Format

```
aBlockTest whileTrue  
aBlockTest whileTrue: aBlockBody  
aBlockTest whileFalse  
aBlockTest whileFalse: aBlockBody
```

The last expression in aBlockTest must evaluate to a boolean

Examples

```
| x y difference |  
x := 8.  
y := 6.  
difference := 0.  
[x > y] whileTrue:  
    [difference := difference + 1.  
     y := y + 1].  
^difference
```

```
| count |  
count := 0.  
[count := count + 1.  
 count < 100] whileTrue.  
Transcript clear; show: count printString
```

Note that with the whileTrue: message we can perform the loop check before we enter the loop, like a while statement in C/C++/Java. The whileTrue message acts like the do while statement in Java.

More Loops

Format

anInteger timesRepeat: aBodyBlock

startInteger to: endInteger do: blockWithArgument

start to: end by: increment do: blockWithArgument

Transcript

```
open;  
clear.
```

3 timesRepeat:

```
[Transcript  
  cr;  
  show: 'Testing!'].
```

1 to: 3 do:

```
[ :n |  
  Transcript  
  cr;  
  show: n printString;  
  tab;  
  show: n squared printString].
```

9 to: 1 by: -2 do:

```
[ :n |  
  Transcript  
  cr;  
  show: n printString].
```
