Techniques

Adopt

Tools

Trial

Worth pursuing

Platforms

Try on projects that can handle risk

Languages & Frameworks

Assess

Worth exploring

How will it affect your enterprise

Hold

Proceed with caution

# TECHNIQUES - Adapt

1. Container security scanning
2. Data integrity at the origin
3. Micro frontends
4. Pipelines for infrastructure as code
5. Run cost as architecture fitness function
6. Testing using real devices

# TECHNIQUES - Trail

7. Automated machine learning (AutoML)
8. Binary attestation
9. Continuous delivery for machine learning (CD4ML)
10. Data discoverability
11. Dependency drift fitness function
12. Design systems
13. Experiment tracking tools for machine learning
14. Explainability as a first-class model selection criterion
15. Security policy as code
16. Sidecars for endpoint security
17. Zhong Tai

# Zhong Tai

An approach to delivering encapsulated business models

Deliver first- rate services without the costs of traditional enterprise infrastructure and enabling existing organizations to bring innovative services to market at breakneck speeds

Developed at Alibaba

# Conway's Law

Organizations which design systems ...

are constrained to produce designs which are copies of the communication structures of these organizations

"If you have four groups working on a compiler, you'll get a 4-pass compiler."

Eric S. Raymond

"If the parts of an organization do not closely reflect the essential parts of the product then the project will be in trouble ...

Therefore: Make sure the organization is compatible with the product architecture."

James O. Coplien and Neil B. Harrison

# TECHNIQUES - Assess

18. BERT

19. Data mesh

20. Ethical bias testing

21. Federated learning

22. JAMstack

23. Privacy-preserving record linkage (PPRL) using Bloom filter

24. Semi-supervised learning loops

# LANGUAGES & FRAMEWORKS

## Trail

- 78. Arrow
- 79. Flutter
- 80. jest-when
- 81. Micronaut
- 82. React Hooks
- 83. React Testing Library
- 84. Styled components
- 85. Tensorflow

## Assess

- 86. Fairseq
- 87. Flair
- 88. Gatsby.js
- 89. GraphQL
- 90. KotlinTest
- 91. NestJS
- 92. Paged.js
- 93. Quarkus
- 94. SwiftUI
- 95. Testcontainers

# Hacker News

<https://news.ycombinator.com>

What every computer science major should know

Dr. Matt Might

University of Utah

<http://matt.might.net/articles/what-cs-majors-should-know/>

What should every student know to get a good job?

What should every student know to maintain lifelong employment?

What should every student know to enter graduate school?

What should every student know to benefit society?

# Portfolio verse Resume

A resume says nothing of a programmer's ability

Portfolio

Personal blog

Projects

Github

Open source projects

# Technical Communication

Lone wolves in computer science are an endangered species

In smaller companies, whether or not a programmer can communicate her ideas to management may make the difference between the company's success and failure

Writing for Computer Science by Zobel.

Even a Geek Can Speak by Asher.

# Unix Philosophy

linguistic abstraction and composition

Should be able to

- Navigate and manipulate the filesystem;

- Compose processes with pipes;

- Comfortably edit a file with emacs and vim;

- Create, modify and execute a Makefile for a software project;

- Write simple shell scripts.

# Unix Philosophy

## Sample tasks

Find the five folders in a given directory consuming the most space

Report duplicate MP3s (by file contents, not file name) on a computer.

Take a list of names whose first and last names have been lower-cased, and properly recapitalize them.

Find all words in English that have x as their second letter, and n as their second-to-last.

Directly route your microphone input over the network to another computer's speaker.

Replace all spaces in a filename with underscore for a given directory.

Report the last ten errant accesses to the web server coming from a specific IP address.

# Systems administration

Every modern computer scientist should be able to:

Install and administer a Linux distribution.

Configure and compile the Linux kernel.

Troubleshoot a connection with dig, ping and traceroute.

Compile and configure a web server like apache.

Compile and configure a DNS daemon like bind.

Maintain a web site with a text editor.

Cut and crimp a network cable.

# Programming languages

Programming languages rise and fall with the solar cycle.

A programmer's career should not.

The best way to learn how to learn programming languages is to learn multiple programming languages and programming paradigms.

To truly understand programming languages, one must implement one.

# Programming languages

Racket

C

JavaScript

Squeak

Java

Standard ML

Prolog

Scala

Haskell

C++

Assembly

# Racket

Aggressively simple syntax

For a small fraction of students, this syntax is an impediment.

To be blunt, if these students have a fundamental mental barrier to accepting an alien syntactic regime even temporarily, they lack the mental dexterity to survive a career in computer science.

Racket's powerful macro system and facilities for higher-order programming thoroughly erase the line between data and code.

If taught correctly, Lisp liberates

How to Design Programs

<https://htdp.org>

# Squeak

Squeak is a modern dialect of Smalltalk, purest of object-oriented languages

It imparts the essence of "object-oriented."

Introductions to Squeak

<http://wiki.squeak.org/squeak/377>

# Architecture

There is no substitute for a solid understanding of computer architecture

transistors

gates

adders

muxes

flip flops

ALUs

control units

caches

RAM

GPU

# Operating systems

Any sufficiently large program eventually becomes an operating system

To get a better understanding of the kernel, students could:

- Print "hello world" during the boot process;

- Design their own scheduler;

- Modify the page-handling policy; and

- Create their own filesystem.

# Networking

Computer scientists should have a firm understanding of the network stack and routing protocols within a network

Every computer scientist should implement the following:

- an HTTP client and daemon;
- a DNS resolver and server; and
- a command-line SMTP mailer.

No student should ever pass an intro networking class without sniffing their instructor's Google query off Wireshark.

# Security

Computer scientists must be aware of the means by which a program can be compromised

At a minimum, every computer scientist needs to understand:

- social engineering

- buffer overflows

- integer overflow

- code injection vulnerabilities

- race conditions

- privilege confusion

Metasploit: The Penetration Tester's Guide

Security Engineering: A Guide to Building Dependable Distributed Systems

# Software testing

Software testing must be distributed throughout the entire curriculum

He uses test cases turned in by students against all other students

Students don't seem to care much about developing defensive test cases, but they unleash hell when it comes to sandbagging their classmates

# Visualization

The modern world is a sea of data

The Visual Display of Quantitative Information by Tufte

# Graphics and simulation

There is no discipline more dominated by "clever" than graphics.

The field is driven toward, even defined by, the "good enough."

As such, there is no better way to teach clever programming or a solid appreciation of optimizing effort than graphics and simulation.

Over half of the coding hacks I've learned came from my study of graphics.

# Topics I left out

Databases

Artificial intelligence

Machine learning

Robotics

Software engineering

Parallelism

User experience design

Disarmingly Forthright MSCS Advice

Nick Black

<http://nick-black.com/dankwiki/images/8/85/Msadvice.pdf>

Read it

# If you'll only take away two things

Read the damn man pages

Check your damn return values

# You're a CS MS student. Act it

Join the ACM and IEEE

Don't embarrass yourself

- Passwords

- Backups

If you don't have at least 100 semi-frequent, provocative/informative RSS feeds you're checking a few times daily, you're not learning enough

# Programming

Vast majority of code you'll read is laughably broken

if you aren't, at any given time, scandalized by code you wrote five or even three years ago, you're not learning anywhere near enough

Seek out, study, and bookmark good code

Learn to program axiomatically

take each element of the system, language, and toolchain, and learn it throughout

Keep all your projects in source control systems like git or svn
