#### https://xkcd.com/2224/

ALL SOFTWARE IS SOFTWARE AS A SERVICE.

## Cohesion

#### Cohesion

"Cohesion is the degree to which the tasks performed by a single module are functionally related."

IEEE, 1983

"Cohesion is the "glue" that holds a module together. It can be thought of as the type of association among the component elements of a module. Generally, one wants the highest level of cohesion possible."

Bergland, 1981

"A software component is said to exhibit a high degree of cohesion if the elements in that unit exhibit a high degree of functional relatedness. This means that each element in the program unit should be essential for that unit to achieve its purpose."

Sommerville, 1989

## **Types of Module Cohesion**

Coincidental (worst)

Logical

Temporal

Procedural

Communication

Sequential

Functional (best)

#### **Coincidental Cohesion**

Little or no constructive relationship among the elements of the module

Common Object Occurrence

Object does not represent any single object-oriented concept

Collection of commonly used source code as a class inherited via multiple inheritance

```
class Rous{
  public static int findPattern( String text, String pattern) { // blah}
  public static int average( Vector numbers ) { // blah}
  public static OutputStream openFile( String fileName ){ // blah}
}
```

### **Logical Cohesion**

Module performs a set of related functions, one of which is selected via function parameter when calling the module

Cure – Isolate each function into separate operations

```
public void sample( int flag ){
  switch (flag){
    case ON:
      // bunch of on stuff
      break;
    case OFF:
      // bunch of off stuff
      break;
    case CLOSE:
      // bunch of close stuff
      break;
    case COLOR:
      // bunch of color stuff
      break;
```

### **Temporal Cohesion**

Elements are grouped into a module because they are all processed within the same limited time period

```
Common example
"Initialization" modules that provide default values for objects
"End of Job" modules that clean up
procedure initializeData() {
  font = "times";
  windowSize = "200,400";
  foo.name = "Not Set";
  foo.size = 12;
  foo.location = "/usr/local/lib/java";
```

## **Temporal Cohesion**

Cure

Each object should have a constructor and destructor

How is this better?

#### **Procedural Cohesion**

Groups processing elements based on procedural or algorithmic relationships

Procedural modules are application specific

In context the module seems reasonable

Outside the context modules seem strange and very hard to understand

Can not understand module without understanding the program and the conditions existing when module is called

Makes module hard to modify, understand

#### **Procedural Cohesion**

```
class LinkedList {
  public boolean add(String item ) { blah }
  public Object get(int index) { blah }
  public Iterator iterator() { blah}
  public Object[] studentsOnProbabation() { blah }
}
```

## Class Builder verse Program writer

#### **Communication Cohesion**

Operations of a module all operate upon the same input data set and/or produce the same output data

Cure - Isolate each element into separate modules

Rarely occurs in object-oriented systems due to polymorphism (overloading)

#### **Sequential Cohesion**

Sequential association the type in which the output data from one processing element serve as input data for the next processing element

A module that performs multiple sequential functions where the sequential relationship among all of the functions is implied by the problems or application statement and where there is a data relationship among all of the functions

Cure – Decompose into smaller modules

#### **Functional Cohesion**

If the operations of a module can be collectively described as a single specific function in a coherent way, the module has functional cohesion

If not, the module has lower type of cohesion

In an object-oriented system:

Each operation in public interface of an object should be functional cohesive

Each object should represent a single cohesive concept

### **Informational Strength Cohesion**

Myers states:

"The purpose of an informational-strength module is to hide some concept, data structure, or resource within a single module.

An informational-strength module has the following definition:

It contains multiple entry points

Each entry point performs a single specific function

All of the functions are related by a concept, data structure, or resource that is hidden within the module"

# **Object Cohesion**

#### **Object Cohesion**

The degree to which components of a class are tied together

Evaluating cohesion requires:

Technical knowledge of the application domain

Some experience in building, modifying, maintaining, testing and managing applications in the appropriate domain

Technical background in and experience with reusability

### Questions to probe cohesiveness of an object

Does the object represent a complete and coherent concept or does it more closely resemble a partial concept, or a random collection of information?

Does the object directly correspond to a "real world entity," physical or logical?

Is the object characterized in very non-specific terms? Collection of data, statistics, etc.

Do each of the methods in the public interface for the object perform a single coherent function?

If the object (or system of objects) is removed from the context of the immediate application, does it still represent a coherent and complete object-oriented concept?

## Questions to probe cohesiveness of system of

Does the system represent an object-oriented concept?

Do all the objects directly support, or directly contribute to the support of, the object-oriented concept that the system represents?

Are there missing objects?

## **Objects in Isolation**

Isolation means without considering any hierarchy that may contain the object or class

### **Individual Objects**

A **primitive method** is any method that cannot be implemented simply, efficiently, and reliably without knowledge of the underlying implementation of the object

A **composite method** is any method constructed from two or more primitive methods – sometimes from different objects

A **sufficient set of primitive methods** for an object is a minimum set of primitive methods to accomplish all necessary work with on the object

A sufficient set of primitive methods has two major problems:

Some tasks may be awkward and/or difficult with just a sufficient set of primitive methods

A sufficient set of primitive methods may not allow us to fully capture the abstraction represented by the object

A **complete set of primitive methods** is a set of primitive methods that both allows us to easily work with the object, and fully captures the abstraction represented by the object.

## To implement Java Collection

```
Subclass java.util.AbstractList and implement add(int index, Object element)
get(int index)
remove(int index)
size()
set(int index, Object element)

Subclass java.util.AbstractCollection and implement add(int index, Object element)
iterator()
size()

Iterator implements
hasNext()
```

Is either of these a sufficient set of primitive methods?

next()

remove()

## Java's ArrayList

addAll(Collection c) add(int index, Object element) add(Object o) addAll(int index, Collection c) clear() clone() contains(Object elem) containsAll ensureCapacity(int minCapacity) hashCode equals get(int index) indexOf(Object elem) isEmpty() iterator lastIndexOf(Object elem) listIterator remove(int index) removeAll retainAll set(int index, Object element) subList size() toArray() toArray(Object[] a) toString trimToSize()

Is this a complete set of primitive methods?

# **Ruby Array**

#### **Levels of Cohesion**

An object is not as cohesive as it could be if the public interface contains:

Only primitive methods, but does not fully capture the abstraction represented by the object

Primitive and composite methods, but does not fully capture the abstraction represented by the object

A sufficient set of primitive methods with composite methods

No primitive methods, just composite methods

#### Note

Objects with a sufficient set of primitive methods with composite methods is more cohesive than objects with out a sufficient set of primitive methods

All public methods must directly support the abstraction represented by the object. The methods must make sense when object is removed from the application

#### **Composite Objects**

A **composite object** is an object that is conceptually composed of two, or more, other objects, which are externally discernible.

**Component objects** are those that make up the composite object.

Component objects are externally discernible if

The externally discernible state of the object is directly affected by the presence or absence of one or more component objects

Component objects can be directly queried or changed via methods in the public interface of the composite object and/or

## Ranking of Cohesion of Composite Objects

Externally discernible component objects not related

Some externally discernible component objects are related, the group component objects does not make sense

The group component objects does not represent a single stable object-oriented concept, but are all bound together some how in an application

A majority of the externally discernible component objects support a single, coherent, object-oriented concept, but at least one does not

All of the externally discernible component objects support a single, coherent, object-oriented concept, but at least one needed is missing

All of the externally discernible component objects support a single, coherent, object-oriented concept, and none are missing

## **Accessing Cohesion of an Individual Object**

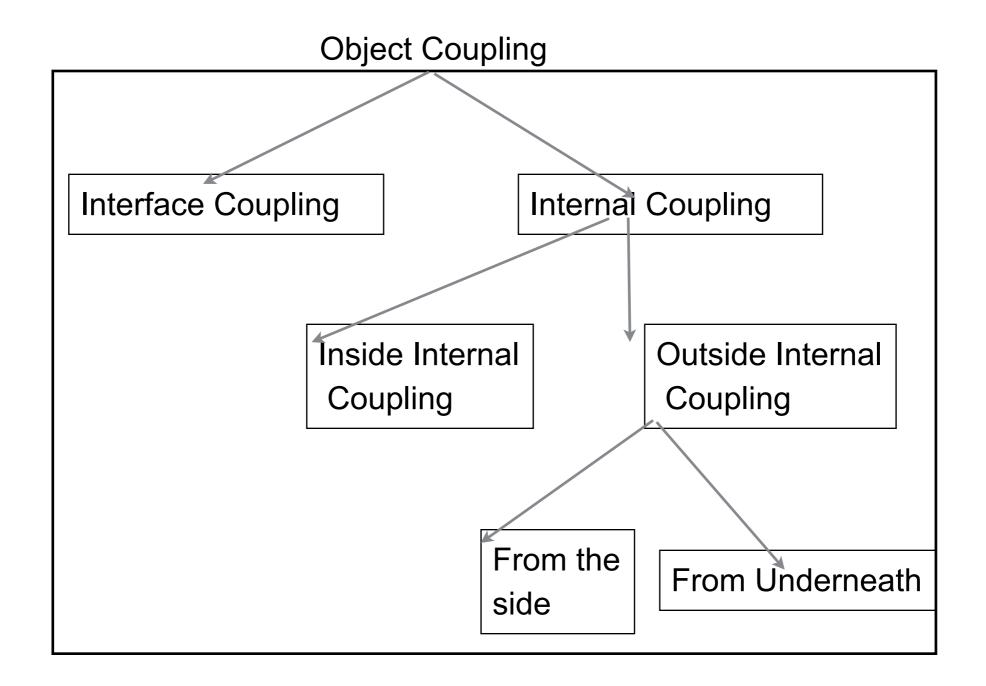

Assessment of the public methods/public non-methods/component objects

Are all the items appropriate for the given object?

Do we have at least a minimally sufficient set of items?

Do we have extra or application-specific items?

# **Object Coupling**

## **Internal Coupling & Cohesion**

#### **Internal Coupling**

Physical relationships among the items that comprise an object

#### Cohesion

Logical relationships among the items that comprise an object

## **Interface Coupling**

One object refers to another specific object, and the original object makes direct references to one or more items in the specific object's public interface

Includes module coupling already covered

Weakest form of object coupling, but has wide variation

#### Issues

Object abstraction decoupling

Selector decoupling

Constructor decoupling

Iterator decoupling

## **Object Abstraction Decoupling**

Assumptions that one object makes about a category of other objects are isolated and used as parameters to instantiate the original object.

```
C++/Java 1.5 Example
class LinkedListCell {
  int cellItem;
  LinkedListCell* next;
  // code can now use fact that cellItem is an int
  if ( cellItem == 5 ) print( "We Win" );
template <class type>
class LinkedListCell#2 {
  type cellItem;
  LinkedListCell* next;
  // code does not know the type, it is just a cell item,
  // it becomes an abstraction
```

#### **Selectors**

Return state information about their encapsulated object and Do not alter the state of their encapsulated object

```
public void display() {
    Swing GUI code to display the counter
}

Selector
    decoupling

public String toString() {return String.valueOf( count );}
```

# **Selector Decoupling**

#### **Counter Example**

```
class Counter{
  int count = 0;

public void increment() { count++; }
  public void reset() { count = 0; }
  public void display() {
    Java Swing code to display the counter in a slider bar
}
```

#### **Selector Decoupled**

```
class Counter{
  int count = 0;

public void increment() { count++; }
  public void reset() { count = 0; }
  public int count() {return count;}
  public String toString() {return String.valueOf( count );}
}
```

#### Counter

#### **Iterator**

Allows the user to visit all the nodes in a homogeneous composite object and to perform some user-supplied operation at each node

#### **Primitive Methods**

Any method that cannot be implemented simply, efficiently, and reliably without knowledge of the underlying implementation of the object

Functionally cohesive, they perform a single specific function

Small, seldom exceed five "lines of code"

#### **Types**

Selectors (get operations)
Constructors (not the same as class constructors)
Iterators

#### **Constructors**

Operations that construct a new, or altered version of an object

```
class Calendar {
   public void getMonth( from where, or what) { blah }
}
class Calendar {
   public static Calendar fromString( String date ) { blah}
}
```

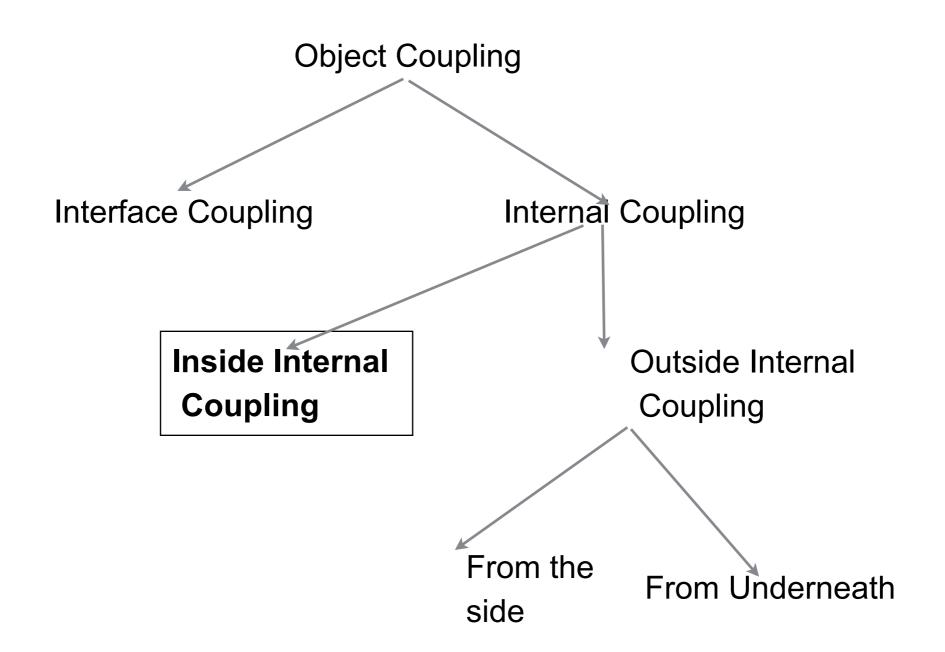

## **Primitive Objects**

Primitive objects are objects that are both:

Defined in the standard for the implementation language Globally known

Primitive objects don't count in coupling with other objects

Why not?

# **Inside Internal Object Coupling**

Coupling between state and operations of an object

The big issue: Accessing state

Changing the structure of the state of an object requires changing all operations that access the state including operations in subclasses

**Solution**: Access state via access operations

C++ implementation

Provide private functions to access and change each data member

## **Outside Internal Coupling from Underneath**

Coupling between a class and subclass involving private state and private operations

#### **Major Issues**

Access to inherited state
Direct access to inherited state
Access via operations

**Unwanted Inheritance** 

Parent class may have operations and state not needed by subclass

## **Outside Internal Coupling from the Side**

Class A accesses private state or private operations of class B

Class A and B are not related via inheritance

#### Main causes

Using non-object-oriented languages
Special language "features"
C++ friends

# Metrics

#### **Metrics**

DeMarco's Principle

Effort moves toward whatever is measured

# The Swedish Army Dictum

When the map and the territory don't agree, always believe the territory.

# **Eclipse Metrics 1.3.6**

Docs

Source Forge Site

http://metrics.sourceforge.net/

http://sourceforge.net/projects/metrics

Generates about 20 metrics
Displays result in tables in Eclipse
Generates dependency graphs

# **Eclipse Metrics Plugin**

http://eclipse-metrics.sourceforge.net/

**Author: Lance Walton** 

Generates about same metrics as Metrics 1.3.6 Exports results to html or csv Generates table and graphs

#### **Lines Of Code**

Rough measure of size

Effort is highly correlated with SLOC

# Physical SLOC Code + comments + blank lines Not count blank lines over 25% of a section Eclipse Metrics - calls this Total Lines of Code (TLOC)

Logical SLOC
Just lines of actual code
Eclipse Metrics
calls this Method Lines of Code (MLOC)
But only code inside method bodies

#### **Basic COCOMO**

Software Cost Estimation Model

Effort Applied = a(KLOC)<sup>b</sup> [ man-months ]

Type a b

Organic 2.4 I.05

Semi-detached 3 1.12

Embedded 3.6 I.2

Organic

Small team, less than rigid requirements

Semi-detached

Medium teams,

Embedded

Tight constraints

# **Example - 2 KLOC Embedded**

Effort Applied = a(KLOC)<sup>b</sup>

[man-months]

Effort Applied =  $3.6*(2)^{1.20}$  = 8.3 man-months

#### **Problems with LOC**

Language differences

Hand written code verses autogenerated code

Programmer variation

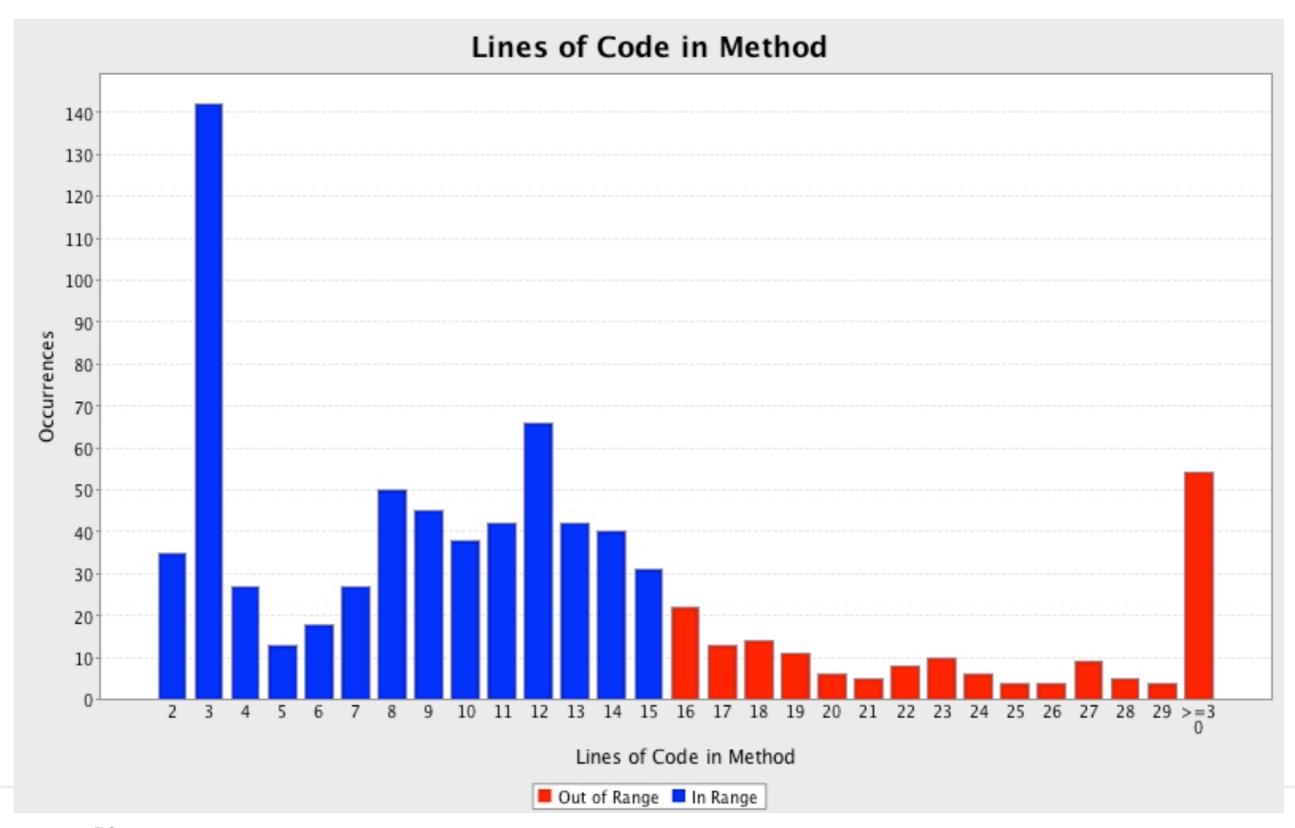

Defining and counting LOC

Coding accounts for about 35% of overall effort

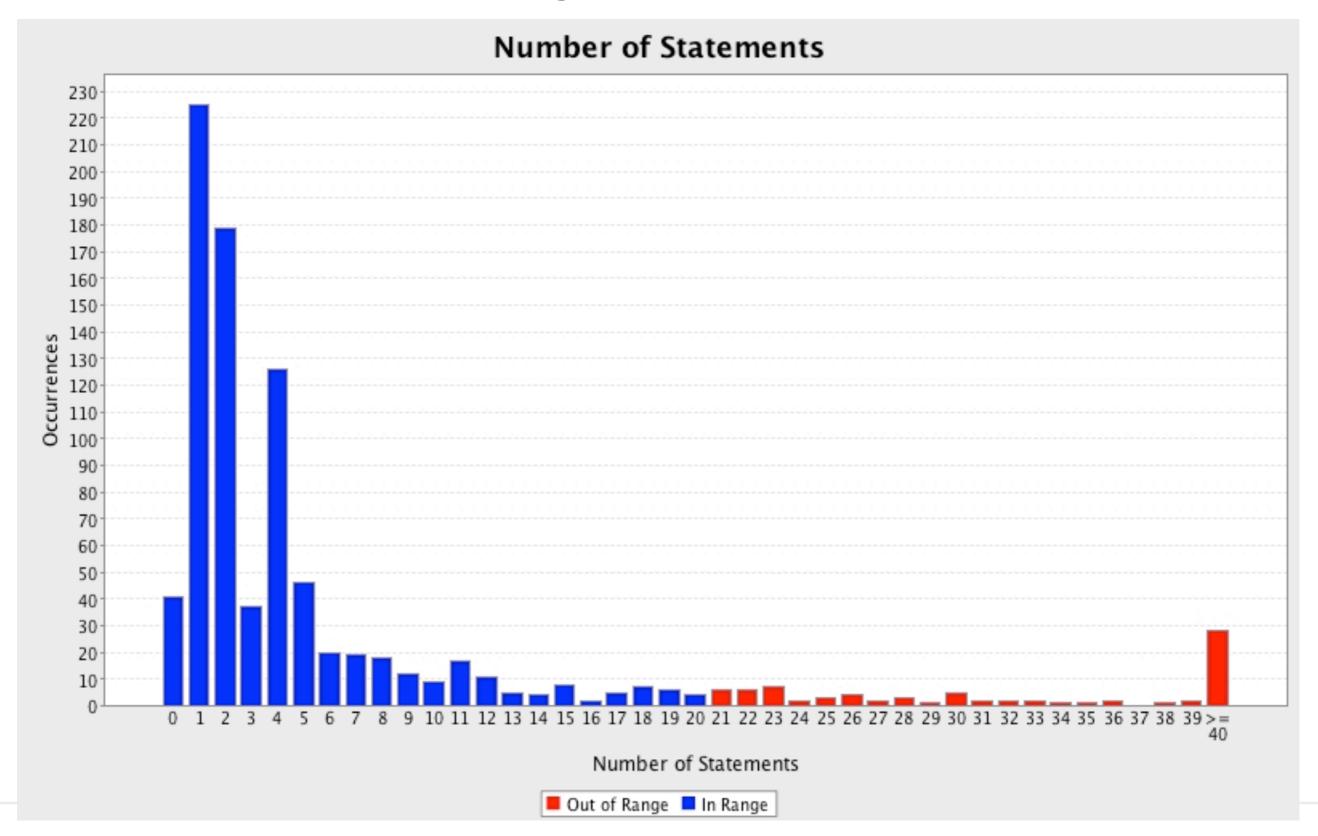

# Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
▼ Total Lines of Code	8161			
▼ java	6908			
twitter4j.org.json	3193			
▶ twitter4j	2489			
twitter4j.http	894			
twitter4j.examples	332

# **Eclipse Metrics Plugin**

# **Eclipse Metrics Plugin**

#### **More Size Metrics**

Number of Packages Number of Interfaces Number of classes per Package

Metric	Total	Mean	Std. Dev.	Maximum
▼ Number of Classes (avg/max per packageFragment	58	9.667	5.558	18
▶ java	49	12.25	4.815	18
▶ java	9	4.5	2.5	7

# **McCabe Cyclomatic Complexity**

Number of linearly independent paths through a program

From graph theory

$$M = E - N + 2P$$

M = cyclomatic complexity

E = the number of edges of the graph

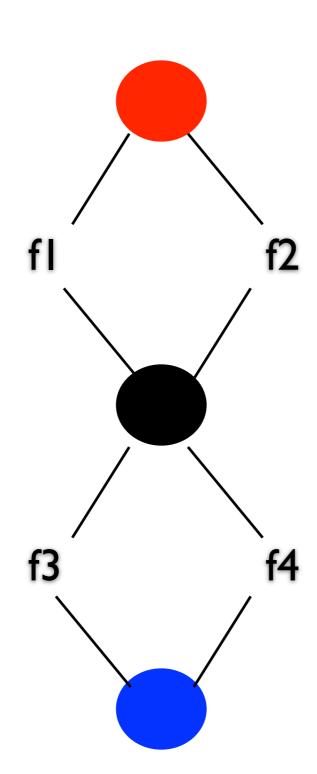

N = the number of nodes of the graph

P = the number of connected components.

# **Example**

if( c1() )
 f1();
else
 f2();

if( c2() )
 f3();
else
 f4();

$$N = 7$$
  
 $E = 8$   
 $M = 8 - 7 + 2*1 = 3$ 

#### What does it tell us?

branch coverage ≤ cyclomatic complexity ≤ number of paths

**Cyclomatic Complexity** 

Is an upper bound for the number of test cases that are necessary to achieve a complete branch coverage

Is a lower bound for the number of paths through the code

# **Cyclomatic Complexity & Quality**

Higher Cyclomatic Complexity might indicate lower cohesion

One study indicated it is better indicator than metrics designed for cohesion

Some evidence that higher Cyclomatic Complexity implies more bugs

# **NIST Structured Testing methodology**

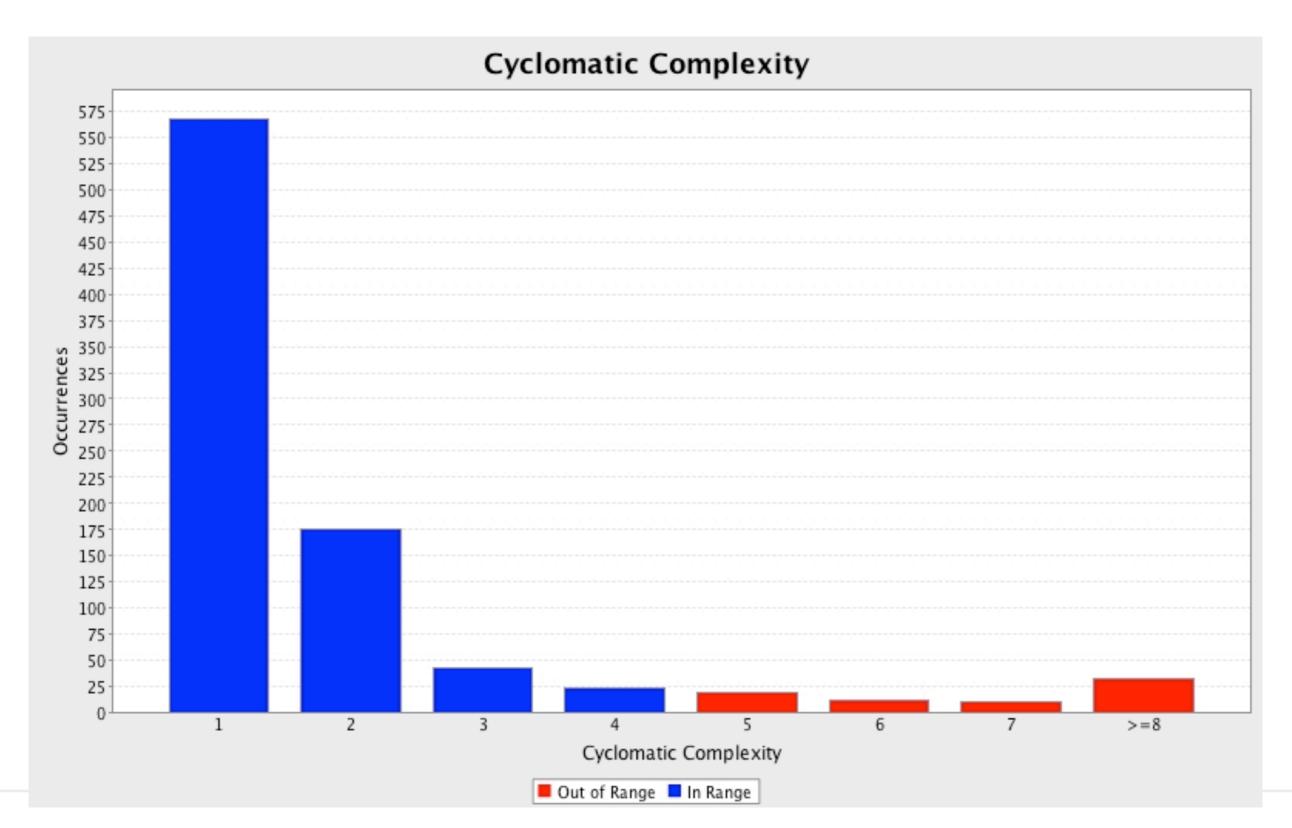

Split modules with cyclomatic complexity greater than 10

It may be appropriate in some circumstances to permit modules with a complexity as high as 15

# **Eclipse Metrics 1.3.6**

#### **Some Inheritance Metrics**

Depth of Inheritance Tree (DIT)

Distance from class Object in the inheritance hierarchy

Number of Children

Total number of direct subclasses of a class

Number of Overridden Methods (NORM)

Specialization Index NORM \* DIT / number of methods

If greater than 5 likely that superclass abstraction has a problem

## Lack of Cohesion in Methods (LCOM)

- M be the set of methods defined by the class
- F be the set of fields defined by the class
- r(f) be the number of methods that access field f, where f is a member of F
- <r> be the mean of r(f) over F.

**High Cohesion** 

When each method accesses all fields

$$< r > = |M|$$

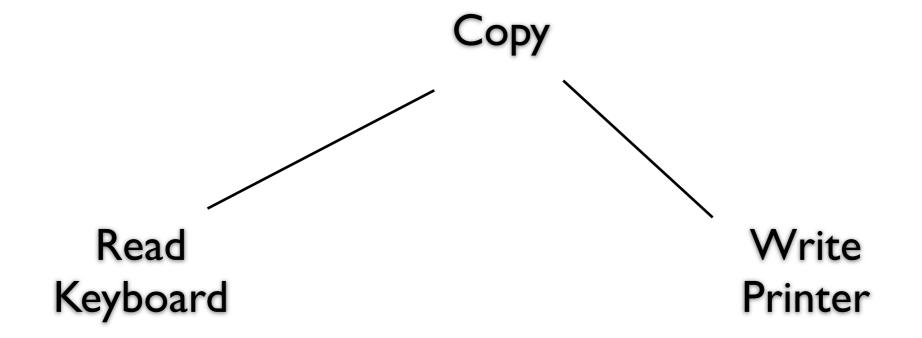

$$LCOM = 0$$

### **Lack of Cohesion of Methods**

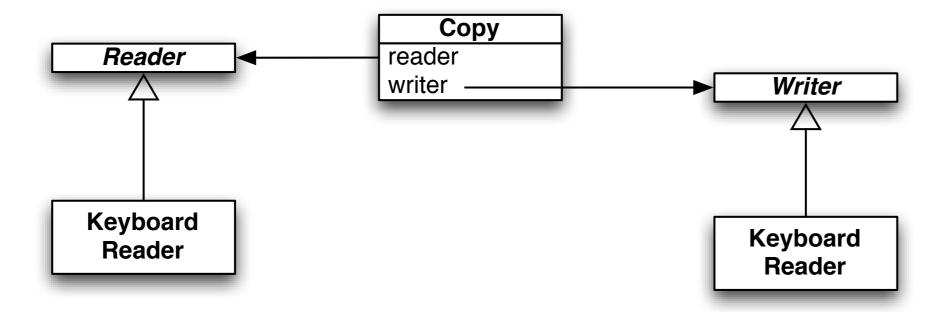

Metric	Total	Mean	Std. Dev.	Maximum
Lack of Cohesion of Methods (avg/max per type)		0.26	0.342	0.938
▼ java		0.25	0.336	0.938
twitter4j.http		0.358	0.348	0.938
► twitter4j		0.461	0.359	0.902
twitter4j.org.json		0.056	0.15	0.5
twitter4j.examples		0.024	0.058	0.167
▶ java		0.319	0.37	0.905

#### **Metrics for Stable Code**

Dependencies make code rigid, fragile and difficult to reuse

#### Flexible version

Have dependencies on Reader/Writer classes But these classes are stable

#### Main Idea

When code depends on other classes, changes to those classes can force the code to change

The fewer classes code depends on the stabler the code is

### **Class Categories**

Group of highly cohesive classes that

1. The classes within a category are closed together against any force of change If one class must change, all classes are likely to change

2. The classes within a category are reused together

3. The classes within a category share some common function or achieve some common goal

## **Dependency Metrics**

Afferent Couplings (Ca)

The number of classes outside this category that depend upon classes within this category

Efferent Couplings (Ce)

The number of classes inside this category that depend upon classes outside this category

Instability (I)

I = 0 means a category is maximally stable

I = 1 means a category is maximally instable

# **Instability Twitter4j Example**

Metric	Total	Mean	Std. Dev.	Maximum
▼ Instability (avg/max per packageFragment)		0.645	0.35	1
▼ java		0.51	0.354	1
twitter4j.examples	1			
twitter4j	0.538			
twitter4j.http	0.5			
twitter4j.org.json	0			
▼ java		0.917	0.083	1
twitter4j.http	1			
twitter4j	0.833			

### How to be flexible and stable?

Use abstract classes

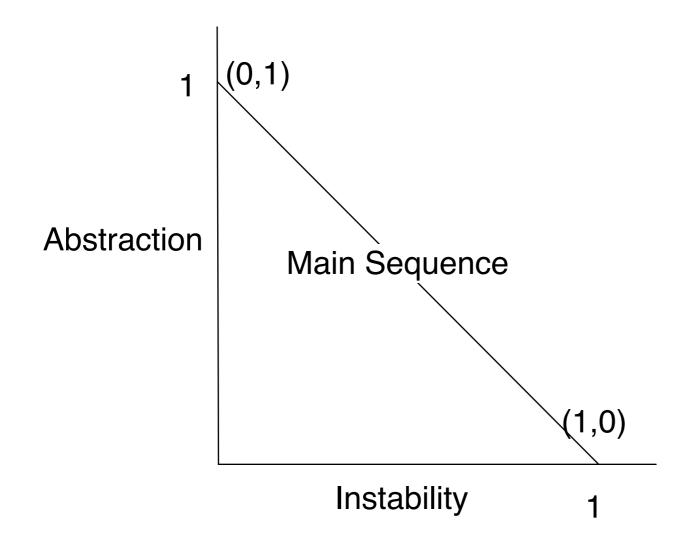

## Abstractness (A)

# of abstract classes in category total # of classes in category

A = 1, all classes are abstract

A = 0, all classes are concrete

## **Main Sequence**

### **Distance From Main Sequence**

$$Dn = |A + I - 1|$$

Dn = 0, category is on the main sequence

Dn = 1, category is far from main sequence

Values not near zero suggest restructuring the category

# Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
▼ Normalized Distance (avg/max per packageFragment)		0.327	0.329	0.941
▼ java		0.449	0.337	0.941
twitter4j.org.json	0.941			
twitter4j.http	0.5			
twitter4j	0.356			
twitter4j.examples	0			
▼ java		0.083	0.083	0.167
twitter4j	0.167			
twitter4j.http	0
