## **Object Coupling**

## **Internal Coupling & Cohesion**

**Internal Coupling** 

Physical relationships among the items that comprise an object

Cohesion

Logical relationships among the items that comprise an object

## Interface Coupling

One object refers to another specific object, and the original object makes direct references to one or more items in the specific object's public interface

Includes module coupling already covered

Weakest form of object coupling, but has wide variation

Issues

Object abstraction decoupling Selector decoupling Constructor decoupling Iterator decoupling

# **Object Abstraction Decoupling**

Assumptions that one object makes about a category of other objects are isolated and used as parameters to instantiate the original object.

```
C++/Java 1.5 Example
```

class LinkedListCell {
 int cellItem;

LinkedListCell\* next;

```
// code can now use fact that cellItem is an int
if ( cellItem == 5 ) print( "We Win" );
```

```
template <class type>
```

}

}

class LinkedListCell#2 { type cellItem; LinkedListCell\* next;

// code does not know the type, it is just a cell item,
// it becomes an abstraction

## **Selector Decoupling**

#### **Counter Example**

```
class Counter{
    int count = 0;
    public void increment() { count++; }
    public void reset() { count = 0; }
    public void display() {
        Java Swing code to display the counter
        in a slider bar
}
```

#### **Selector Decoupled**

```
class Counter{
    int count = 0;

    public void increment() { count++; }
    public void reset() { count = 0; }
    public int count() {return count;}
    public String toString() {return String.valueOf( count );}
}
```

### Selectors

Return state information about their encapsulated object and Do not alter the state of their encapsulated object

```
public void display() {
    Swing GUI code to display the counter
}
```

Selector decoupling

public String toString() {return String.valueOf( count );}

# **Primitive Methods**

Any method that cannot be implemented simply, efficiently, and reliably without knowledge of the underlying implementation of the object

Functionally cohesive, they perform a single specific function

Small, seldom exceed five "lines of code"

### Types

Selectors (get operations) Constructors (not the same as class constructors) Iterators

## **Composite method**

Any method constructed from two or more primitive methods

sometimes from different objects

## **Primitive Objects**

Primitive objects are objects that are both:

Defined in the standard for the implementation language Globally known

Primitive objects don't count in coupling with other objects

Why not?

## Constructors

Operations that construct a new, or altered version of an object

```
class Calendar {
    public void getMonth( from where, or what) { blah }
}
```

```
class Calendar {
    public static Calendar fromString( String date ) { blah}
}
```

## **Composite Object**

Object **conceptually** composed of two or more objects

#### **Heterogeneous Composite Object**

Object **conceptually** composed from objects which are not all **conceptually** the same

class Date{ int year; int month; int day; }

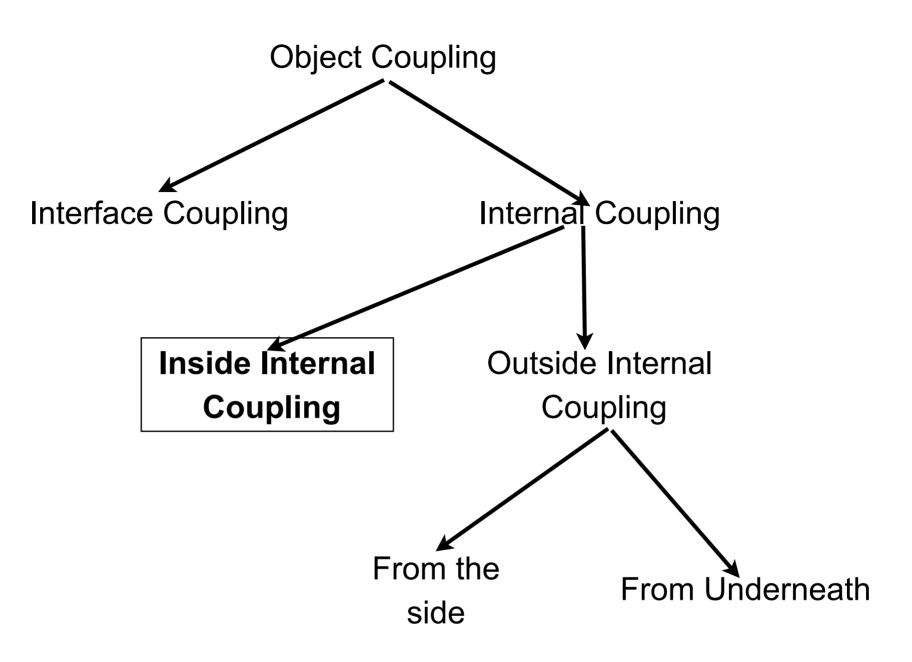

#### **Homogeneous Composite Object**

Object conceptually composed from objects which are all conceptually the same

list of names - each item is a member of the same general category of object – a name

### Iterator

Allows the user to visit all the nodes in a homogeneous composite object and to perform some user-supplied operation at each node

# **Inside Internal Object Coupling**

Coupling between state and operations of an object

### The big issue: Accessing state

Changing the structure of the state of an object requires changing all operations that access the state including operations in subclasses

**Solution**: Access state via access operations

C++ implementation Provide private functions to access and change each data member

## **Outside Internal Coupling from Underneath**

Coupling between a class and subclass involving private state and private operations

### **Major Issues**

Access to inherited state Direct access to inherited state Access via operations

**Unwanted Inheritance** 

Parent class may have operations and state not needed by subclass

## **Outside Internal Coupling from the Side**

Class A accesses private state or private operations of class B

Class A and B are not related via inheritance

#### Main causes

Using non-object-oriented languages Special language "features" C++ friends

### **Metrics**

## **Metrics**

DeMarco's Principle

Effort moves toward whatever is measured

# The Swedish Army Dictum

When the map and the territory don't agree, always believe the territory.

## **Eclipse Metrics 1.3.6**

Eclipse plugin

Docs

http://metrics.sourceforge.net/

Source Forge Site

http://sourceforge.net/projects/metrics

Generates about 20 metrics Displays result in tables in Eclipse Generates dependency graphs

# **Eclipse Metrics Plugin**

http://eclipse-metrics.sourceforge.net/

Author: Lance Walton

Generates about same metrics as Metrics 1.3.6 Exports results to html or csv Generates table and graphs

# Lines Of Code

SLOC

Rough measure of size

Effort is highly correlated with SLOC

Physical SLOC

Code + comments + blank lines Not count blank lines over 25% of a section Eclipse Metrics - calls this Total Lines of Code (TLOC)

Logical SLOC

Just lines of actual code

Eclipse Metrics

calls this Method Lines of Code (MLOC)

But only code inside method bodies

# Basic COCOMO

### Software Cost Estimation Model

Effort Applied = a(KLOC)<sup>b</sup>

[man-months]

Туре	а	b
Organic	2.4	1.05
Semi-detached	3.0	1.12
Embedded	3.6	1.20

#### Organic

Small team, less than rigid requirements

Semi-detached

Medium teams,

Embedded

**Tight constraints** 

## Example - 2 KLOC Embedded

Effort Applied =  $a(KLOC)^{b}$ 

[man-months]

Effort Applied =  $3.6^{(2)^{1.20}}$  = 8.3 man-months

## **Problems with LOC**

Language differences

Hand written code verses autogenerated code

Programmer variation

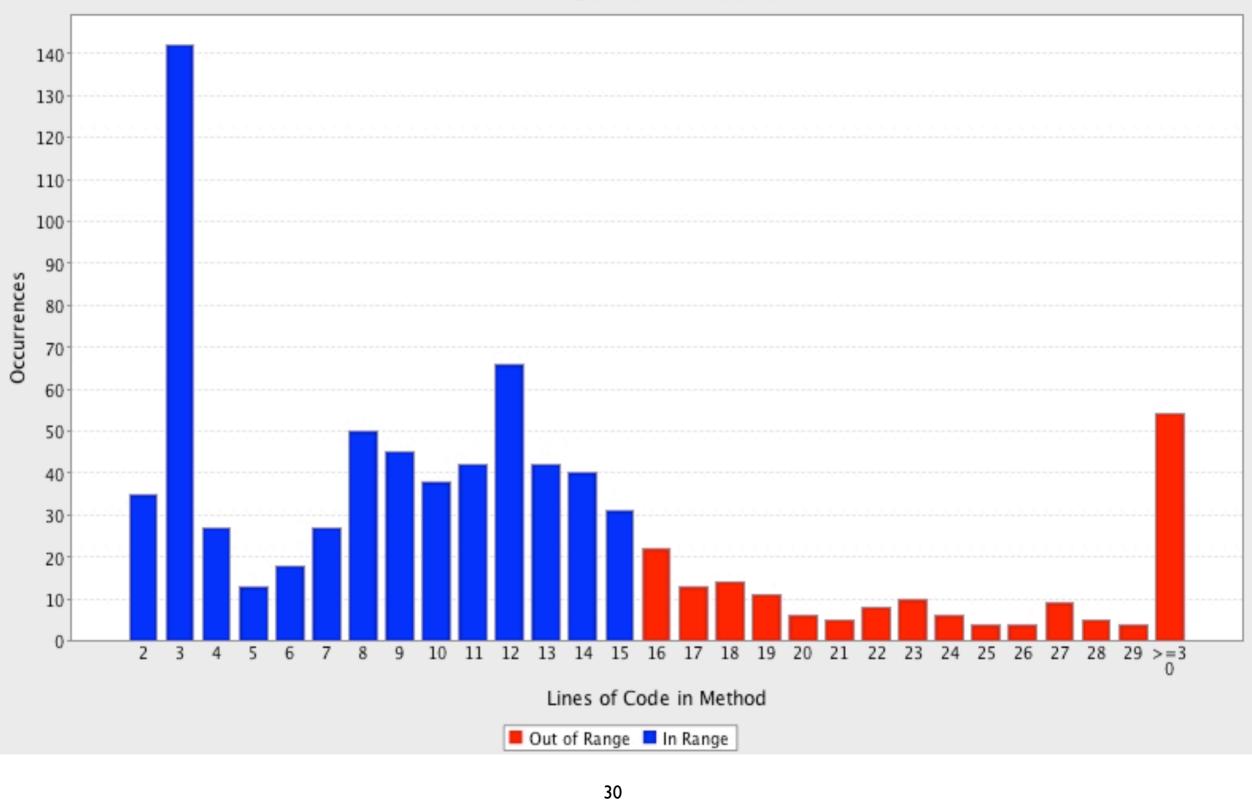

Defining and counting LOC

Coding accounts for about 35% of overall effort

# Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
Total Lines of Code	8161			
▼ java	6908			
twitter4j.org.json	3193			
twitter4j	2489			
twitter4j.http	894			
twitter4j.examples	332			
▼ java	1253			
twitter4j	1115			
twitter4j.http	138			
Method Lines of Code (avg/max per method)	5854	7.254	22.032	518
▼ java	4899	6.949	22.726	518
twitter4j.org.json	2759	14.295	41.037	518
twitter4j.http	557	5.626	10.117	76
twitter4j.examples	240	26.667	14.877	57
twitter4j	1343	3.324	4.324	29
▼ java	955	9.363	16.298	123
twitter4j	853	9.374	16.949	123
twitter4j.http	102	9.273	9.304	33

## **Eclipse Metrics Plugin**

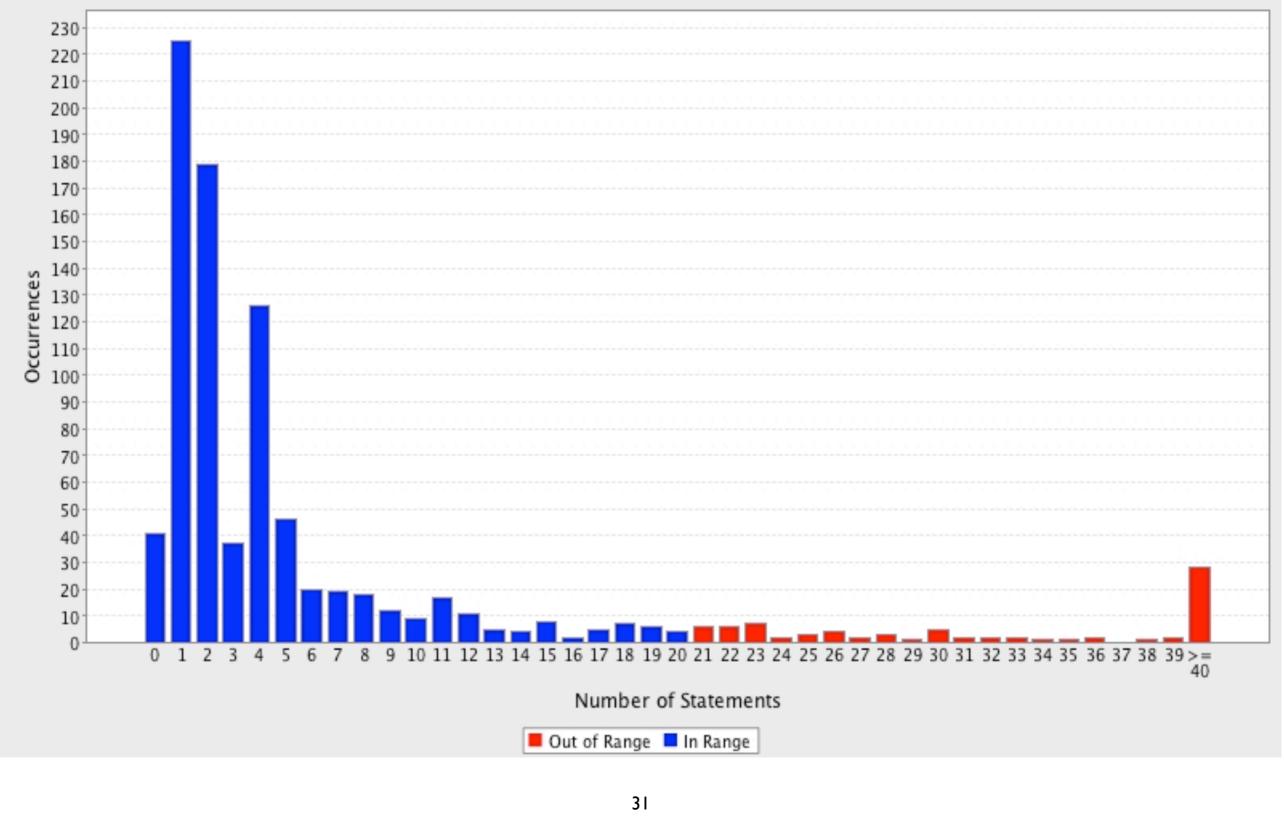

#### Lines of Code in Method

Thursday, March 3, 2011

Metrics 1.3.6 finds 8161 total lines of code. Eclipse Metrics Plugin finds 11113 total lines of code as it does not remove large segments of white space

## **Eclipse Metrics Plugin**

#### Number of Statements

Thursday, March 3, 2011

Number of statements = Logical LOC. Not the difference from the graph on the previous slide.

## **More Size Metrics**

Number of Packages Number of Interfaces Number of classes per Package

Metric	Total	Mean	Std. Dev.	Maximum
Number of Classes (avg/max per packageFragment	58	9.667	5.558	18
▶ java	49	12.25	4.815	18
▶ java	9	4.5	2.5	7

Thursday, March 3, 2011

The number of interfaces might be considered a metric related to abstraction. Although (number of interfaces / number of class) per package might be a better metric. At least in Java. Abstraction is a better metric for this.

## **McCabe Cyclomatic Complexity**

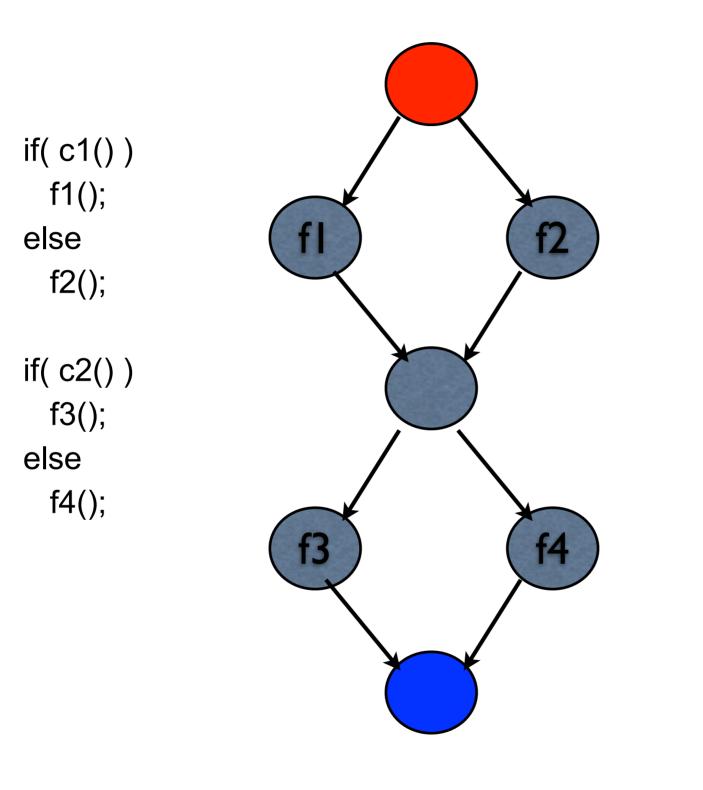

Number of linearly independent paths through a program

From graph theory

M = E - N + 2P

M = cyclomatic complexityE = the number of edges of the graphN = the number of nodes of the graphP = the number of connected components.

## Example

N = 7 E = 8 M = 8 - 7 +  $2^*1 = 3$ 

Thursday, March 3, 2011 Example From http://en.wikipedia.org/wiki/Cyclomatic\_complexity

# What does it tell us?

branch coverage ≤ cyclomatic complexity ≤ number of paths

Cyclomatic Complexity

Is an upper bound for the number of test cases that are necessary to achieve a complete branch coverage

Is a lower bound for the number of paths through the code

# **Cyclomatic Complexity & Quality**

Higher Cyclomatic Complexity might indicate lower cohesion One study indicated it is better indicator than metrics designed for cohesion

Some evidence that higher Cyclomatic Complexity implies more bugs

## **NIST Structured Testing methodology**

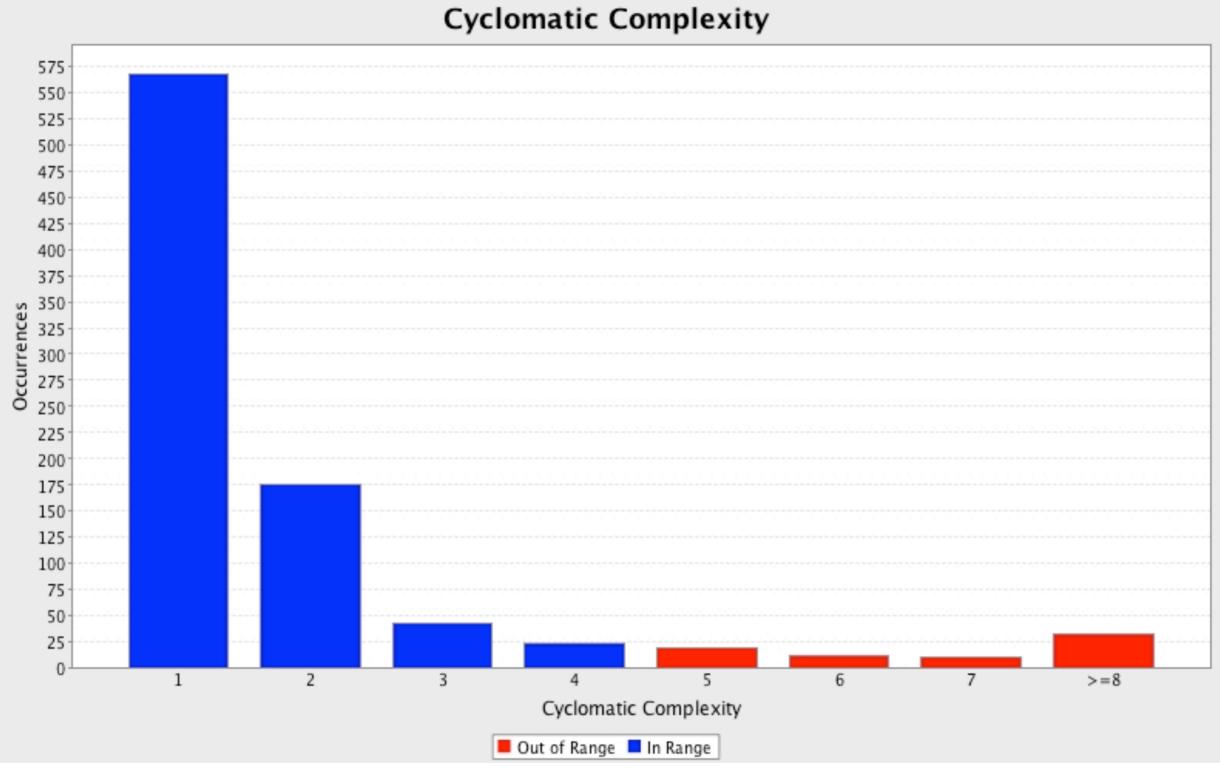

Split modules with cyclomatic complexity greater than 10

It may be appropriate in some circumstances to permit modules with a complexity as high as 15

## **Eclipse Metrics 1.3.6**

Metric	Total	Mean	Std. Dev.	Maximum
McCabe Cyclomatic Complexity (avg/max per method)		2.15	3.569	46
🔻 java		2.288	3.787	46
twitter4j.org.json		4.212	5.9	46
JSONML.java		10.286	15.229	46
XML.java		11.5	12.42	36
XMLTokener.java		12.143	9.463	28
Test.java		21	0	21
JSONObject.java		3.552	4.306	19
JSONTokener.java		4.688	3.531	14

# Weighted Methods per Class (WMC)

Sum of the McCabe Cyclomatic Complexity for all methods in a class

Metric	Total	Mean	Std. Dev.	Maximum
Weighted methods per Class (avg/max per type)	1735	29.914	41.206	235
🔻 java	1613	32.918	43.423	235
twitter4j.org.json	813	50.812	57.857	235
twitter4j	569	31.611	33.705	140
twitter4j.http	201	25.125	29.464	100
twitter4j.examples	30	4.286	3.01	11
▼ java	122	13.556	18.963	56
twitter4j	110	15.714	20.899	56
twitter4j.http	12	6	4	10

## **Basic Class Metrics**

Number of methods per class Number of static methods per class Number of attributes(fields) per class Number of static attributes per class

Number of parameters per method

## Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
Number of Methods (avg/max per type)	742	12.793	21.461	111
🔻 java	641	13.082	22.274	111
twitter4j	398	22.111	29.04	111
twitter4j.org.json	151	9.438	16.948	55
twitter4j.http	90	11.25	14.481	49
twitter4j.examples	2	0.286	0.7	2
▶ java	101	11.222	16.253	52
Number of Parameters (avg/max per method)		0.954	0.901	6
🔻 java		1.033	0.918	6
twitter4j		1.017	0.999	6
twitter4j.http		0.97	1.039	6
twitter4j.org.json		1.104	0.652	3
twitter4j.examples		0.889	0.314	1
🕨 java		0.412	0.512	2

# **Nested Block Depth**

The depth of nested blocks of code

Depth = 2

```
public static JSONObject toJSONObject(String string) throws JSONException {
    JSONObject o = new JSONObject();
    JSONTokener x = new JSONTokener(string);
    while (x.more()) {
        String name = Cookie.unescape(x.nextTo('='));
        x.next('=');
        o.put(name, Cookie.unescape(x.nextTo(';')));
        x.next();
    }
    return o;
}
```

```
Thursday, March 3, 2011
```

## Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
Nested Block Depth (avg/max per method)		1.489	0.938	8
🔻 java		1.549	0.984	8
twitter4j.org.json		2.047	1.348	8
JSONML.java		3.143	2.642	8
XML.java		3.833	2.672	8
JSONObject.java		1.881	1.153	6
CDL.java		2.5	1.5	5
Cookie.java		3.25	0.829	4
JSONTokener.java		2.375	1.053	4
CookieList.java		3	1	4
HTTPTokener.java		2.5	1.5	4
XMLTokener.java		2.857	0.833	4
JSONArray.java		1.58	0.851	4
JSONWriter.java		1.786	1.013	4
Test.java		3	0	3
HTTP.java		2.5	0.5	3
JSONException.java		1	0	1
JSONStringer.java		1	0	1
JSONString.java		0	0	
twitter4j.examples		3	1.054	5
twitter4j.http		1.465	0.868	5
twitter4j		1.3	0.619	4
🕨 java		1.078	0.269	2

### **Some Inheritance Metrics**

Depth of Inheritance Tree (DIT)

Distance from class Object in the inheritance hierarchy

Number of Children

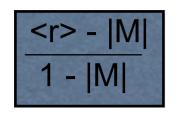

Total number of direct subclasses of a class

Number of Overridden Methods (NORM)

Specialization Index NORM \* DIT / number of methods

If greater than 5 likely that superclass abstraction has a problem

## Lack of Cohesion in Methods (LCOM)

M be the set of methods defined by the class

- F be the set of fields defined by the class
- r(f) be the number of methods that access field f, where f is a member of F
- <r>> be the mean of r(f) over F.

High Cohesion	Low Cohesion
When each method accesses all fields <r> =  M </r>	When each method accesses one fields <r> = 1</r>
LCOM = 0	LCOM = 1

Thursday, March 3, 2011

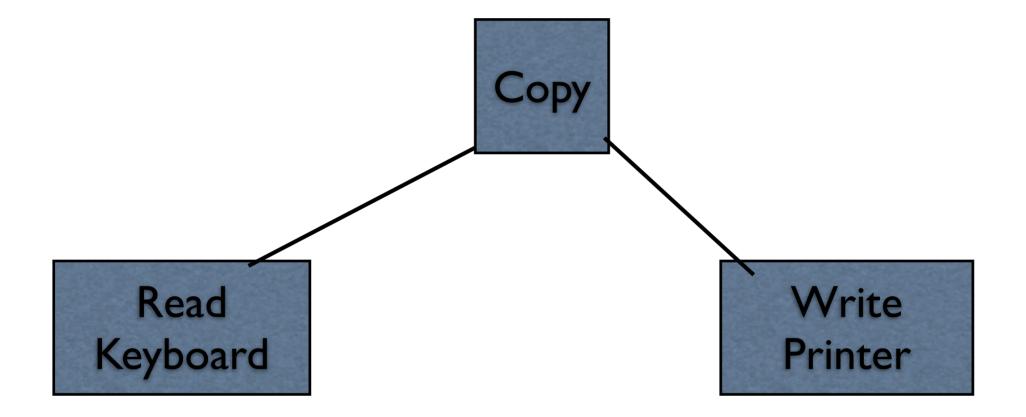

Some people recommend that you create an accessor for each field. When you need to access the field in the class you use the accessor, rather than access the field directly. This will give you a LCOM of 1. One has to be careful with metrics.

## Lack of Cohesion of Methods

Metric	Total	Mean	Std. Dev.	Maximum
Lack of Cohesion of Methods (avg/max per type)		0.26	0.342	0.938
🔻 java		0.25	0.336	0.938
twitter4j.http		0.358	0.348	0.938
twitter4j		0.461	0.359	0.902
twitter4j.org.json		0.056	0.15	0.5
twitter4j.examples		0.024	0.058	0.167
🕨 java		0.319	0.37	0.905

#### **Metrics for Stable Code**

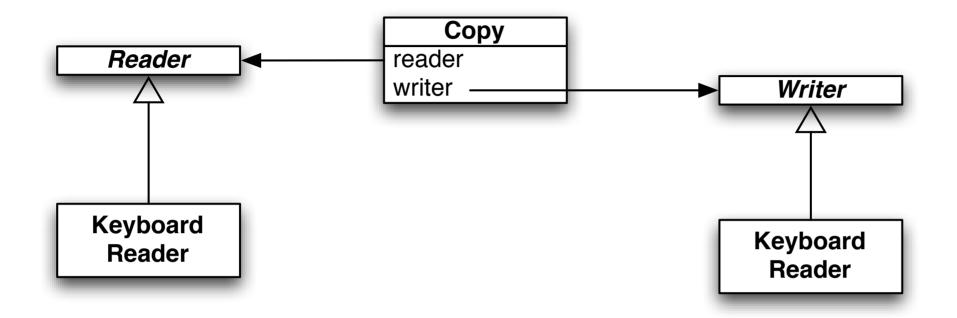

Dependencies make code rigid, fragile and difficult to reuse

Thursday, March 3, 2011

Consider a program that copies characters typed on a keyboard to a printer. Rest of lecture is from OO Design Quality Metrics: An Analysis of Dependencies, Robert Martin, http://www.objectmentor.com/resources/articles/oodmetrc.pdf

#### **Flexible version**

Have dependencies on Reader/Writer classes But these classes are stable

#### Main Idea

When code depends on other classes, changes to those classes can force the code to change

The fewer classes code depends on the stabler the code is

#### **Class Categories**

Group of highly cohesive classes that

1. The classes within a category are closed together against any force of change

If one class must change, all classes are likely to change

2. The classes within a category are reused together

3. The classes within a category share some common function or achieve some common goal

## **Dependency Metrics**

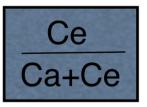

Afferent Couplings (Ca)

The number of classes outside this category that depend upon classes within this category

Efferent Couplings (Ce)

The number of classes inside this category that depend upon classes outside this category

Instability (I)

I = 0 means a category is maximally stable

I = 1 means a category is maximally instable

# Instabilty Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
Instability (avg/max per packageFragment)		0.645	0.35	1
▼ java		0.51	0.354	1
twitter4j.examples	1			
twitter4j	0.538			
twitter4j.http	0.5			
twitter4j.org.json	0			
▼ java		0.917	0.083	1
twitter4j.http	1			
twitter4j	0.833			

#### How to be flexible and stable?

Use abstract classes

## Abstractness (A)

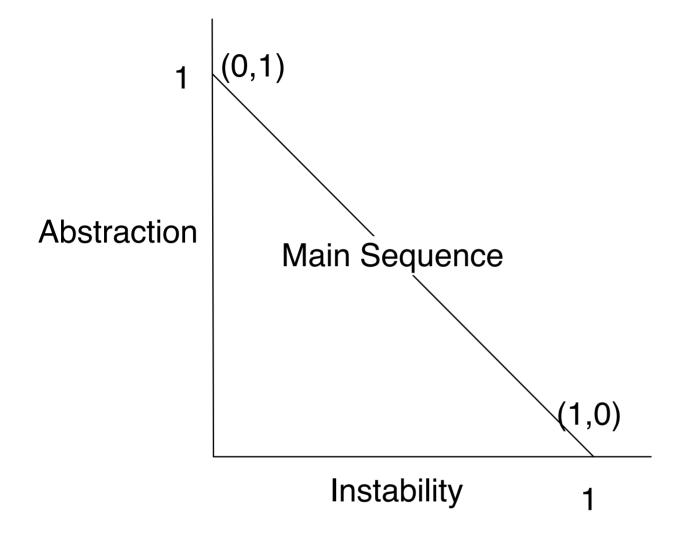

# of abstract classes in category

total # of classes in category

A = 1, all classes are abstract

A = 0, all classes are concrete

#### **Main Sequence**

## **Distance From Main Sequence**

Dn = | A + I - 1 |

Dn = 0, category is on the main sequence

Dn = 1, category is far from main sequence

Values not near zero suggest restructuring the category

#### Twitter4j Example

Metric	Total	Mean	Std. Dev.	Maximum
Normalized Distance (avg/max per packageFragment)		0.327	0.329	0.941
▼ java		0.449	0.337	0.941
twitter4j.org.json	0.941			
twitter4j.http	0.5			
twitter4j	0.356			
twitter4j.examples	0			
🔻 java		0.083	0.083	0.167
twitter4j	0.167			
twitter4j.http	0
