Project Grading

Working code 25 pts

Quality of code 10 pts
    Names, structure, organization

Size of project 10 pts
    Not the size of the data set, but what did you do with the data.

Analysis 25 pts
    The project had some goals. What did you do to achieve the goals? Did you apply the algorithms correctly? Did you interpret the results of the algorithms correctly?

Write up 25 pts
    What were you trying to accomplish in the project? What are the results? I should be able to learn both without having to read your code. I should not have to infer the

results by looking at tables or graphs. Instead, you should state the results back up with the output of your code.

ReadMe 5 pts

What are the dependencies of your code? How do I install them? How do I run your project?
